

CAN BE INSTALLED EVERYWHERE

ERGON[®] can be installed in any situation: private dwellings, schools, hospitals, hotels, elderly care homes, etc.

A standard counter frame is enough to install an ERGON[®] door.

INNOVATIVE TECHNOLOGY

While opening and closing, the simultaneous rotation and translation movement of the door cuts swing space in half when compared a traditional hinged door.

This characteristic, in association with the dual swing direction (again by pushing in the direction of movement), makes small rooms or passageways easily accessible with an ERGON[®] door.

NO UNCERTAINTY IN RELATION TO SWING DIRECTION

While opening and closing, the simultaneous rotation and translation movement of the door cuts swing space in half when compared a traditional hinged door. This characteristic, in association with the dual swing direction (again by pushing in the direction of movement) makes small rooms or passageways easily accessible with an ERGON[®] door. The door pushes open as easily as a conventional door.

IDEAL FOR PEOPLE WITH DISABILITIES

The movement of the segmental arch door and dual swing opening allow a disabled person to access or exit the same room by simply pushing the door. A door needs no longer be a barrier for anyone with a disability.
